Project Name	Voice-Based Concept Understanding Analyzer (VBCUA)
Maximum Marks	4 Marks

Customer Journey Map: VBCUA — Student Perspective

A customer journey map visualises the end-to-end experience a user has with a product, from initial awareness through to after the core experience is complete. It captures the steps, interactions, goals, positive and negative moments, and opportunities for improvement at each stage, helping the team understand the student's experience of the Voice-Based Concept Understanding Analyzer (VBCUA) as a whole rather than as isolated features.

SCENARIO

Discovering VBCUA, recording and uploading a spoken concept explanation, receiving an automated assessment, and reviewing the results.

	Entice <i>How does someone initially become aware of this process?</i>	Enter <i>What does the student experience as they begin the process?</i>	Engage <i>In the core moments of the process, what happens?</i>	Exit <i>What does the student typically experience as the process finishes?</i>	Extend <i>What happens after the experience is over?</i>
Steps <i>What does the student typically experience?</i>	Hears about VBCUA from an instructor or course material as a tool for assessing spoken explanations.	- Opens the VBCUA web app. - Reviews the sidebar (objectives, supported formats). - Records a spoken explanation using a separate device or app.	- Uploads the audio file (WAV/MP3/M4A). - Waits while the file is transcribed and analysed. - Views the transcript, score, grade, and feedback.	- Reads the written feedback. - Downloads the PDF assessment report.	- Re-attempts the explanation to try to improve the score. - Shares the PDF report with an instructor outside the app.
Interactions <i>People / Places / Things involved at each step.</i>	Instructor announcement or course syllabus mention.	Streamlit web interface (main page and sidebar).	File uploader widget; Whisper transcription (backend); Sentence Transformer similarity computation (backend);	Feedback panel; “Download PDF Report” button.	Re-upload workflow within the same session; email or LMS used to share the PDF outside the app.

	Entice <i>How does someone initially become aware of this process?</i>	Enter <i>What does the student experience as they begin the process?</i>	Engage <i>In the core moments of the process, what happens?</i>	Exit <i>What does the student typically experience as the process finishes?</i>	Extend <i>What happens after the experience is over?</i>
			results panel (metric, grade badge, feedback).		
Goals & Motivations <i>"Help me..." or "Help me avoid..."</i>	Help me understand what this tool is for and whether it affects my grade.	Help me know what audio format I need and that I'm using the tool correctly.	- Help me confirm my file uploaded correctly. - Help me see clearly what I actually said. - Help me understand how well I explained the concept.	- Help me keep a record of this attempt. - Help me know what to do next if my score was low.	- Help me improve my understanding before the real assessment. - Help me show my instructor my progress.
Positive Moments <i>What does the student find enjoyable, motivating, or reassuring?</i>	Curiosity about a new, more active way to demonstrate understanding.	The upload interface is clean, simple, and clearly labelled.	- An objective percentage score and grade feel concrete and fair. - Feedback text explains the grade in plain language.	A downloadable, well-formatted PDF gives a tangible takeaway.	Being able to retry immediately builds confidence.
Negative Moments <i>What does the student find frustrating, confusing, or time-consuming?</i>	Uncertainty about how the audio evaluation actually works; some anxiety about being assessed by an automated tool.	No built-in microphone recording, so audio must be recorded separately before uploading.	- No progress indicator during transcription and analysis, so the app can feel stalled. - A poor-quality recording can lead to transcription errors.	- Generic feedback text gives little concrete guidance for a low score. - No report history; the PDF is only available within the current session.	No score history or trend view, so the student cannot easily see improvement across attempts.
Areas of Opportunity <i>How might we make each step better?</i>	Provide a short in-app walkthrough or sample explanation the first time the app is opened.	Add real-time, in-browser microphone recording to remove the separate recording step (future scope).	- Add a visible progress indicator during transcription and analysis. - Flag low-confidence transcriptions and prompt the student to re-record.	- Provide concrete suggested next actions for each grade tier. - Persist report history across sessions.	Add a student performance dashboard / score history to visualise improvement across attempts (future scope).
